#TalkLike (actually this is a really fast context sensitive auto-completion app)

# The idea: Context sensitive auto-completion

- Depending on the task or context the program learns a dataset.
  - We can feed it mails, chat-history or even just task-related documents.  
\* *(by hand at the moment)*
  - We either handpick the set, or bind it to the task: outlook for work, private for telegram/gmail/whatsapp.  
\* *(by hand at the moment)*
  - We analyse the words and index the likeliness of a word to follow: auto-complete suggestions:  
Eg: Most likely, Less likely, Less likely  
\* *(Now we gamify by selecting and feeding a random generator: make it spout sentences based on randomness in likelihood.)*
-

## An example: My autocomplete in SwiftKey

- This is not context sensitive and annoyingly the same for whatever I do on my android phone.

No way, my dreams  
come back to be a  
British James Bond?

I just lost some liquid.

# What we used

- Node.js
- Github
- WebStorm
- Markov chains
- Our brains
- Kaggle sets
- ArvaJS
- ECMAScripts
